

Construction

Construction Management — Full Talk Track & Objection Handling

Word-for-word, with stage directions. ► marks what to click; italiCS mark how to say it. ~12-14 minutes. Every path here is real on the live build.

Internal sales enablement • Say it like a conversation, not a pitch

SECTION 0

Before you start

Setup — 2 minutes before the call

- Log in, land on **Construction** → **Dashboard**.
- Open **Al Noor Tower** in a second tab — the "critical" project (3 variations, behind schedule).
- Have ready: an **RA Billing** record, and **Reporting** → **Statement of Account**.
- Confirm reports open in AED and print cleanly.

Mindset: you're not selling software. You're showing them their own Monday — with the leaks closed. Talk less, let the screen work, pause after each "aha."

SECTION 1 · 60 SEC

Open on the pain, not the product

Calm, conversational. Screen still OFF — just talk.

"Before I show you anything — can I tell you what I think actually costs construction companies money? It's not the big disaster. It's the small gaps. The variation agreed on site that never made it onto a bill. The payment certificate that sat in an inbox for a week. The project everyone *felt* was slipping, but nobody could prove until month-end — when it was already too late to fix."

Pause. Then share screen.

"So instead of a feature tour, let me walk you through a normal month, and show you those gaps closing. Sound good?"

SECTION 2 · 2 MIN

The Dashboard — "see trouble before it costs you"

► **Show the Dashboard. Don't explain widgets. Let them look 3 seconds.**

"This is the first thing your team sees every morning. No reports to run, no spreadsheets to open. Just — where do we stand, today."

► **Point to Critical Alerts / Project Health Matrix.**

"See this? Al Noor Tower — actual progress 28% against a planned 74%. A 46-day delay, flagged in red, *right now*. Not at month-end. Today. While you can still do something about it."

Pause — let it land. This is the emotional hook.

"How do you spot a project sliding like this today?"

Let them answer ("month-end reports" / "site manager calls me"), nod, then:

"Right. And by then the delay's already baked in. This just moves that moment forward by three weeks."

SECTION 3 · 2.5 MIN

Variations — "capture every change, bill every dirham"

"Here's the one that quietly bleeds margin. Scope changes."

► **Open Al Noor Tower → click the Variations smart button (↔).**

"On this one project alone — three variations. Extra waterproofing, a façade upgrade the client asked for, an MEP reroute. Real money: the façade alone is AED 642,000."

► **Click New (opens already set to Variation Order).**

"Logging a new one is this fast. The site engineer agrees a change, opens this, types what it is and the amount — under a minute. Captured the moment it happens, not three weeks later when nobody remembers the number."

► **Close without saving. Back to project → Print → VO Register.**

"And the payoff: every variation on the project, totalled, on one certificate for the client or consultant. Nothing slips through. Nothing walks off the job unbilled."

Objection bait — pause:

"Be honest — how many variations get agreed on site each month and never make it onto an invoice?"

SECTION 4 · 2.5 MIN

Billing — "a week of work becomes one click"

"Now the part your QS dreads — interim billing."

► **Open an RA Billing record → Print → RA Billing Certificate.**

"Normally a day or two — rebuilding numbers in a spreadsheet every cycle. Here it's already calculated. Previous billed, this period, retention, net payable — printed as a clean certificate, in AED, ready to send. One click."

► **Reporting → Statement of Account → open a customer → Print → Statement of Account.**

"When the client asks 'where do we stand on payments?' — you don't go digging. Full statement, running balance, instantly."

"Faster certificates mean faster cash. That's not a feature — that's your cash flow."

SECTION 5 · 1.5 MIN

The forward view — "know where it'll land"

► On a project → Print → Cost-to-Complete, then Print → Cash Flow Forecast.

"Most systems tell you what you've *spent*. The question that matters is what this project will *finish* at. Cost-to-complete, projected margin, cash flow forecast — the numbers your bank and board ask for, without anyone staying late to build them."

SECTION 6 · 90 SEC

The close — "a day in the life"

Slow down. This is the whole pitch in four sentences.

"Let me play back the month we just walked through. **Morning** — you open the dashboard and see the one project that needs you. **On site** — a variation's agreed, your engineer logs it in thirty seconds. **Mid-month** — you raise the billing and the certificate prints itself. **Month-end** — leadership sees the real position, in one report."

Pause.

"Notice what we *didn't* do. No spreadsheets. No chasing inboxes. No rebuilding numbers at 9pm. It's the same work your team already does — just without the leaks."

Then, quietly:

"What would it be worth to catch even one slipping project, or one unbilled variation, a month earlier?"

Stop talking. Let them respond.

SECTION 7

Objection handling

Rule: agree first, then reframe. Never argue. Every objection is really "help me feel safe." Lower the risk.

"It looks complicated / my team isn't technical."

(Warm, reassuring.) "Totally fair — that's why I kept this to four screens. Your engineer logs a variation the way they'd send a WhatsApp. The complexity is under the hood; the daily use is a button. Want your least technical person to try logging one, right now?"

"We already have a system / we use Excel."

"Excel's brilliant — until two people edit the same file, or a variation lives in someone's head instead of the sheet. The difference isn't features, it's that nothing depends on someone remembering. Keep Excel for what it's good at; let this catch the leaks it can't."

"How much does it cost? / It's expensive."

(Reframe to the leak, not the price.) "Let me answer with a question — one unbilled variation a month, how much is that? On Al Noor it was AED 642,000 for a single change. It pays for itself the first time it catches one. Let's look at your actual numbers."

"We don't have time to implement / change now."

"Everyone's flat out — that's the point. This isn't a new process on top of your day; it replaces the spreadsheet shuffle you already do. We start with one project, not the whole company. Two weeks, one site, you decide from there."

"What if the data's wrong / we don't trust the numbers?"

"Good — you *should* be skeptical. Everything traces back to a source: the VO register is just the variations your team entered, the billing is your contract figures. Nothing's invented — it just stops things falling through."

"Does it handle [specific feature X]?"

(Never bluff.) "Honestly — let me show you exactly what it does today rather than promise. If X isn't there yet, I'll tell you straight and we'll note it. What's driving the need for X — what problem are you solving?"

"Let me think about it."

(Don't push. Pin the next step.) "Of course — it's a real decision. Can I make it concrete? Let's put *your* numbers on one of your real projects this week. Thinking about it with your own data beats thinking from memory. Which project should we use?"

SECTION 8

One-liners to land

Use sparingly — one per moment, never stacked.

See trouble before it costs you.

Capture every variation — bill every dirham.

Certificates and statements in one click.

Know where a project will land, not just where it's been.

It's the same work you do today — just without the leaks.

SECTION 9

Do / Don't

Do

Pause after each pain. Ask questions. Use their project names. Let silence do the closing. Show only what you'll use.

Don't

Open menus you won't use. Read every field. Demo features they didn't ask about. Talk over the "aha" moment. Discount before you've shown the leak.
