

Construction

Construction Management — Sales Demo

Most teams don't lose money on the big disaster. They lose it in the small gaps — the variation nobody logged, the certificate stuck in an inbox, the overrun everyone felt but couldn't prove until month-end. This is a short look at those gaps closing.

~12 minute walkthrough • Practical, day-to-day, no deep feature tour

Five pains they live with (but rarely say out loud)

Open the Executive Dashboard and let them look — don't narrate. Then walk these five, each tied to one real screen. The point isn't features; it's the daily ache each one removes.

1 "I find out a project is bleeding after it's already bled."

Hidden pain: cost and schedule slip silently; by the time it hits a report, the damage is locked in.

Resolved: the Dashboard's Health Matrix & Critical Alerts flag it today — "actual 28% vs planned 74%, 46 days delay" — before the client calls you.

Show: [Construction](#) → [Dashboard](#) → [Project Health Matrix & Critical Alerts](#)

2 "Variations slip through the cracks."

Hidden pain: scope changes agreed verbally on site, never logged, never billed — pure margin gone.

Resolved: log each agreed change under Documents → Variation Orders with its amount; it flows straight onto the project's VO Register. Nothing walks off the job unbilled.

Show: [Construction](#) → [Documents](#) → [Variation Orders](#) → [New](#); then [project](#) → [Print](#) → [VO Register](#)

3 "Billing the client is a week of spreadsheet archaeology."

Hidden pain: each cycle the QS rebuilds the interim certificate by hand — slow cash, tired team.

Resolved: RA Billing Certificate and Statement of Account print in one click, in AED, ready to send.

Show: [Billing](#) → [RA Billing](#) → [Print](#) → [RA Billing Certificate](#); then [Reporting](#) → [Statement of Account](#)

4 "I know what it's spent — not what it'll finish at."

Hidden pain: teams track cost-to-date; the question that matters is cost-to-complete. Driving by the mirror.

Resolved: Cost-to-Complete and Cash Flow Forecast show the projected landing point your bank and board actually want.

Show: [open a project](#) → [Print](#) → [Cost-to-Complete](#), and [Print](#) → [Cash Flow Forecast](#) (project print-outs)

5 "Every report looks different and half are wrong."

Hidden pain: mixed formats, wrong currency, headers unreadable in print.

Resolved: one consistent, board-ready set — AED throughout, wide tables in landscape, every certificate clearly from the same company.

Show: [print two or three reports side by side](#)

A day in the life

Walk one short loop, narrating as a site/QS person actually works. This single loop is the whole pitch.

1

Morning. Open the Dashboard → see the one project that needs attention today.

2

On site. A variation is agreed → log it under Documents → Variation Orders with its amount (30 seconds); it flows onto the project's VO Register.

3

Mid-month. Raise the RA Billing → print the certificate → send to the client.

4

Month-end. Cost-to-Complete + Executive Portfolio report → leadership sees the real position.

"Notice what we **didn't** do: no spreadsheets, no chasing inboxes, no rebuilding numbers. The same work you do today — just without the leaks."

LEAVE THESE ON SCREEN

The takeaways

See trouble before it costs you.

Capture every variation — bill every dirham.

Certificates and statements in one click.

Know where a project will land, not just where it's been.

One consistent, board-ready set of reports.
